to peiyuwu@romansunstone.com, Joy, Wayne, me, Vincent, Support 

Hi Peiyu,

Thank you for following up. We understand the urgency of your request.

We would be happy to assist with all three items. However, please note that your team currently has no remaining label points, which are required before we can proceed with any support or modifications.

To move forward, your team will need to purchase at least 3 additional points. Once the points have been secured, we can immediately begin working on the following:

1. Padding Zero — This can be achieved using a substitution or expression to pad the string with leading zeros to a fixed length (We can help you create the data element for this).
2. Adding Spaces Within a String — This can also be handled using a custom expression or substitution to format the string with the required spacing (We can help you create the data element for this).
3. Master Pack Label Printing All Stores — We will need to review the label configuration to determine why all stores are printing instead of only the 6 assigned cartons. We would need to review from the site (tenant) from where it was printed.

Please let us know once additional points have been purchased and we will prioritize addressing these items right away.

Best regards,

Jann Carlo Montecalvo

Director of Operations

RE: Ucc128 label for JCP

Hi Jann,

I am following up this email. It is urgent. If you need a meeting, please send a invite.

We have 3 questions regarding how to modify existing label model: **iStar-8A-Packing for JCPenny**

1. How to add padding zero to the string? For example, if the data is 12345 we want to show 012345; if the data is 123456 we want to show 123456 (see below screenshot 1)
2. How to add space within the string? For example, if the data is 00006146110000000047 we want to show (00) 0 0614611 000000004 7 (see below screenshot 1)
3. We are using **iStar-5A-MasterPackingCartonLabel** you built for us. We only assign 6 cartons to the master pack and only select 1 master pack carton to print, however, system prints out all the stores. We expect to see only 6 stores on 1 label. Please advise. (see below screenshot 2)
